recitation time: Friday 8 am Annika Muehlbradt

Project Title: a wearable watch with projector

My idea is developing a wearable smart watch without a physical screen and has a little projector insider which can display on the arms. Because I have a apple watch, the screen is too small and can only see the time or have a notification from my phone. That's so hard to see the detail and do more things like watching video, looking for website and playing games with such a little screen. Apple has try its best to design a good interaction to enhance watch's ability. But that's not enough for people who has the same demand as me. We want more function on watch. In this new watch, we will design a projector insider the watch. At first sight, it is just a watch without a screen. However, if we flip the wrist, projector will start. There will be a virtual screen about 7 inch displaying on our arms. We can see the time, application on that. People who do camping or skiing don't need to bring a phone with them. They only need that watch to see the time and sporting data. That looks so amazing.
